

12th EEMI Bauhaus Stepping Towards Real Performance and Metered Energy Efficiency

1 Decarbonisation Constrains Our Energy System

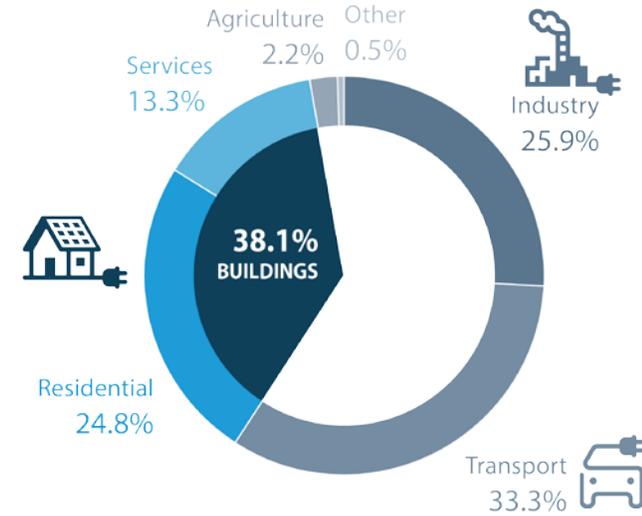

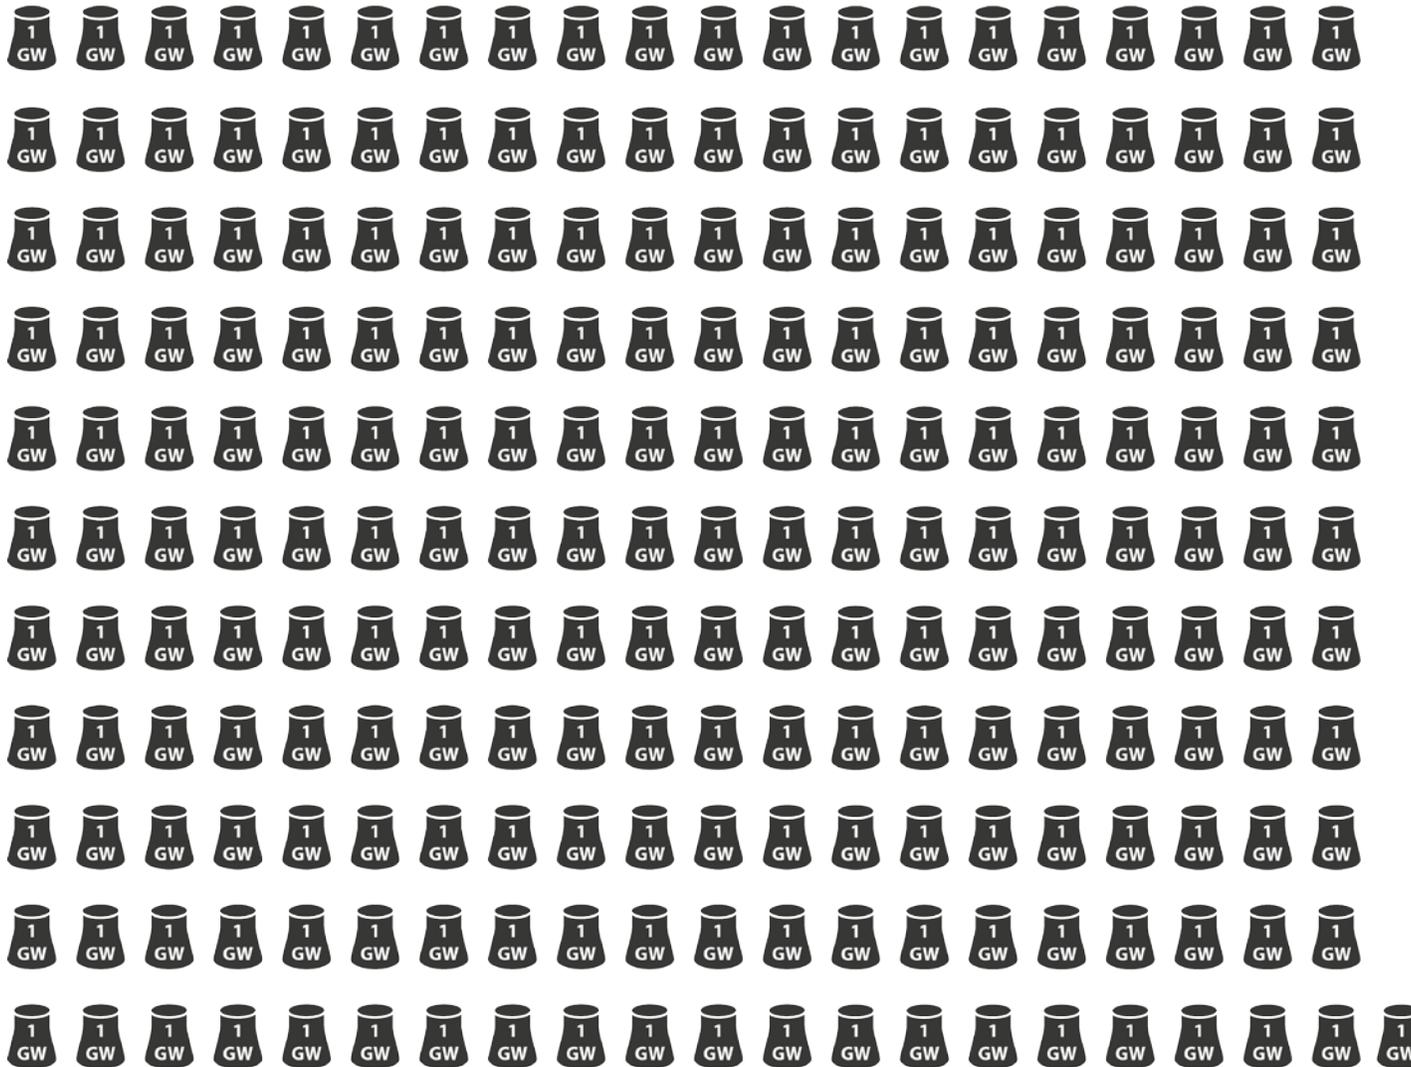

**MAJOR
ENERGY
TRANSITION**

 **We have to electrify
almost everything**

1

Electrifying Heating in Buildings Has Scale Constraints

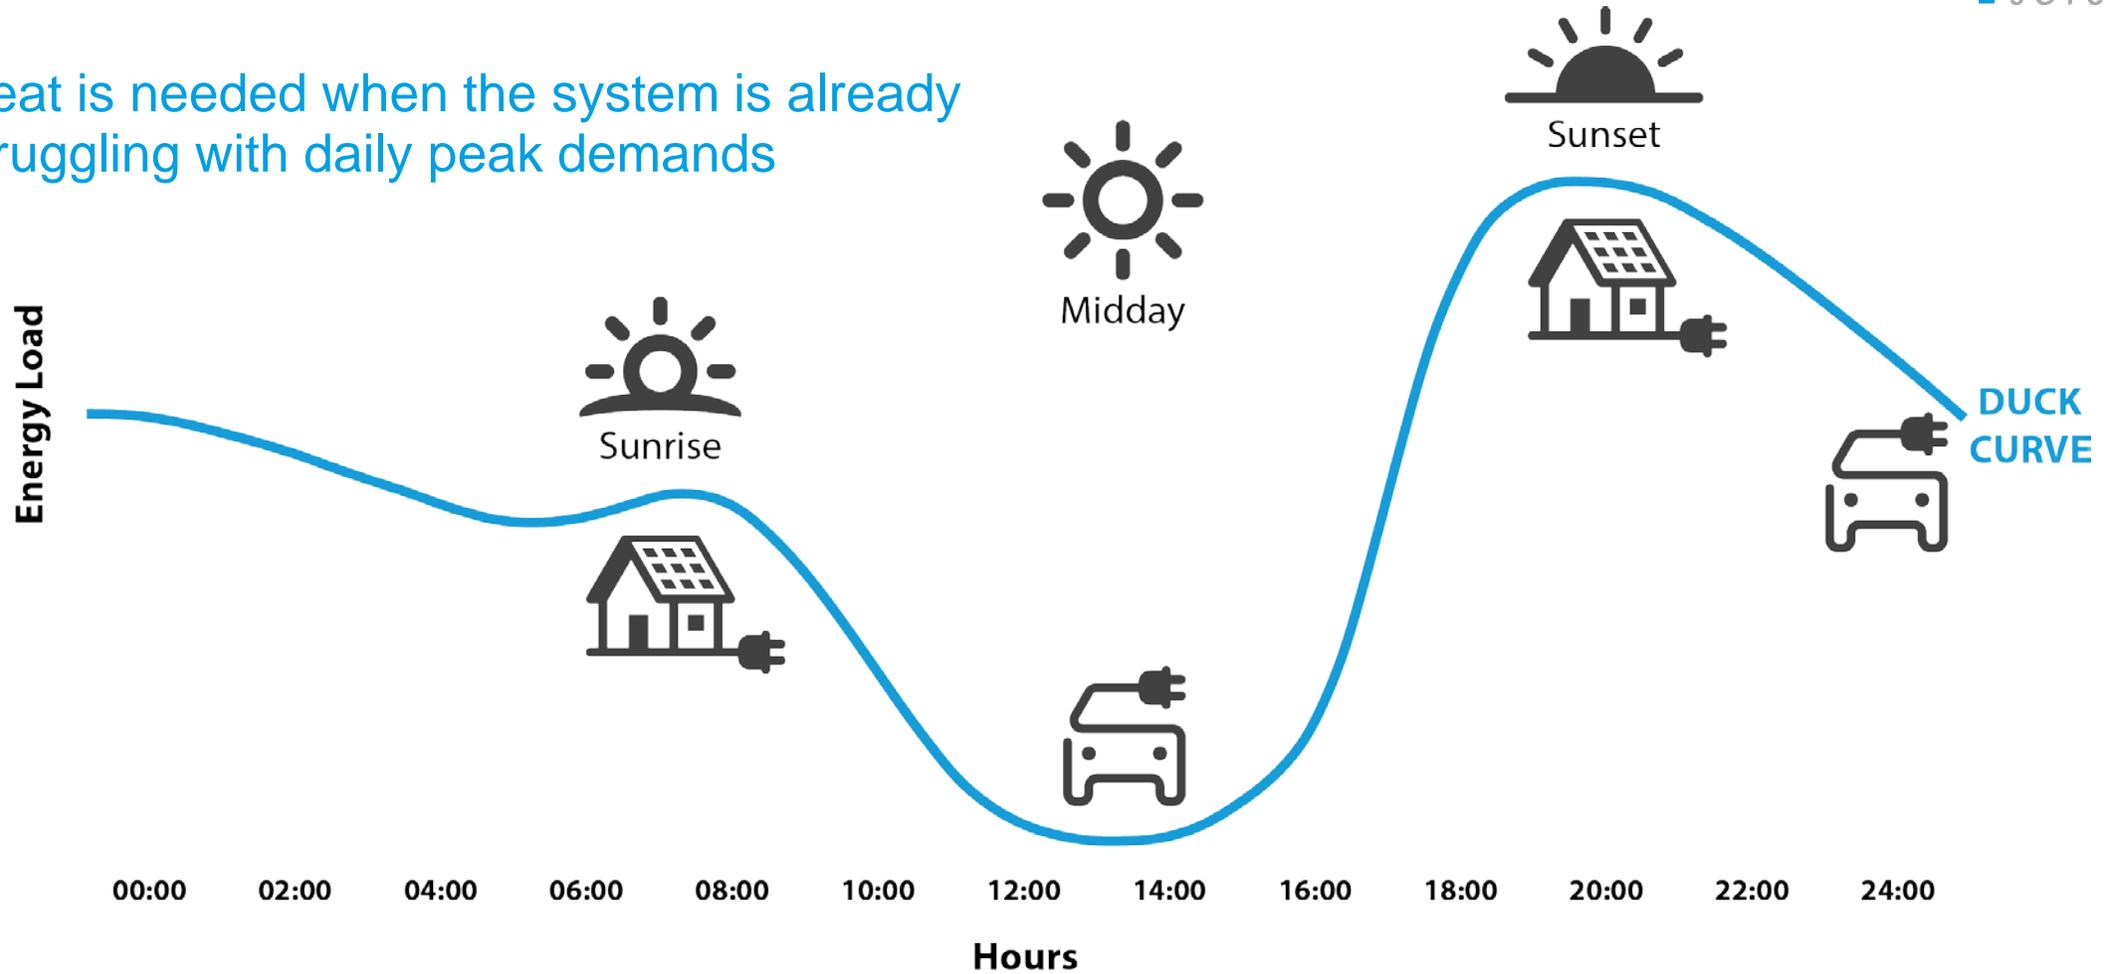

Buildings account for almost **40% of all EU Energy Demand** and are currently primarily supplied through solid fuels

Moving to 70% of current heat being delivered by electricity will increase demand by the equivalent of **221 One Gigawatt Power Plants**

1 Electrifying Heating in Buildings Has Daily Constraints

Heat is needed when the system is already struggling with daily peak demands

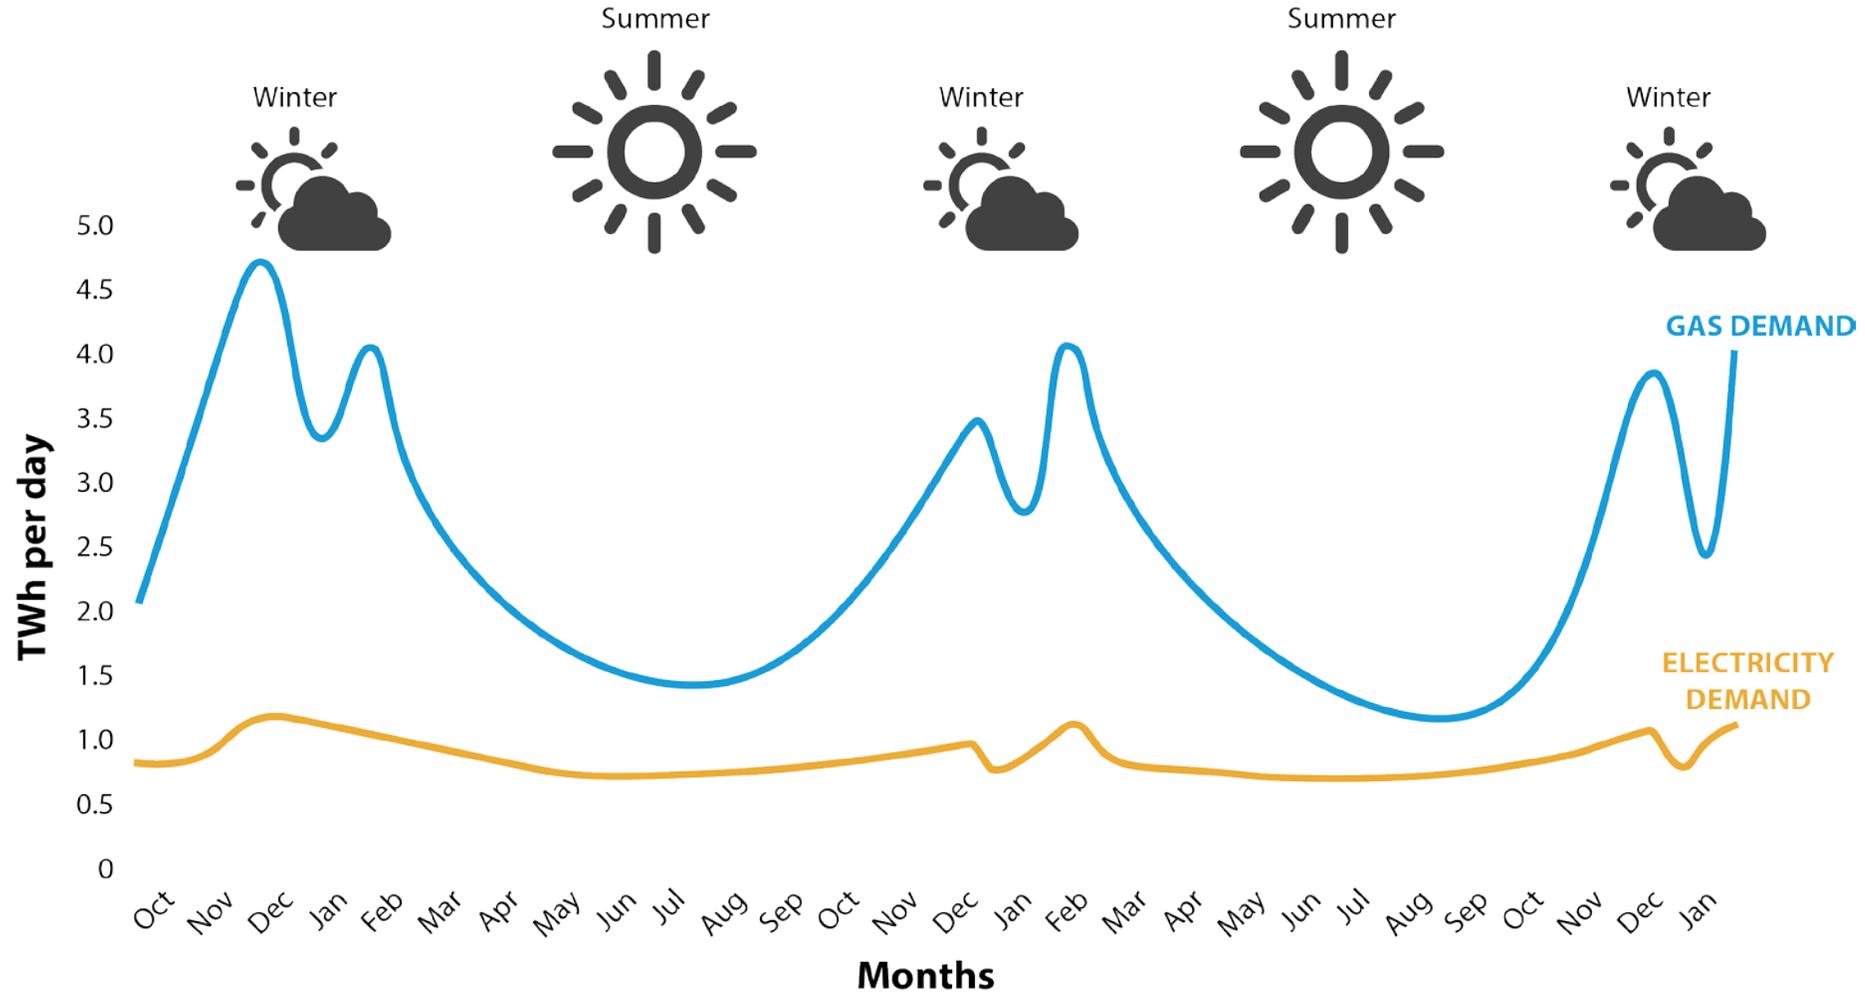

Electrifying vehicles is less challenging for the electricity supply, as vehicles can be charged off-peak & support grid during peak loads

1

Electrifying Heating in Buildings Has Seasonal Constraints

Heat is needed in winter when solar production is at its lowest

Smart Retrofits Drastically Reduce the Cost of the Transition to Low Carbon and Gas Free Europe

100,000 Smart
Retrofits

€800 million

=

32.6 tWh of Power
Generation

€2.65 billion

That's 68% Cheaper Than Power Generation

1 Electrifying Buildings Has Market Constraints

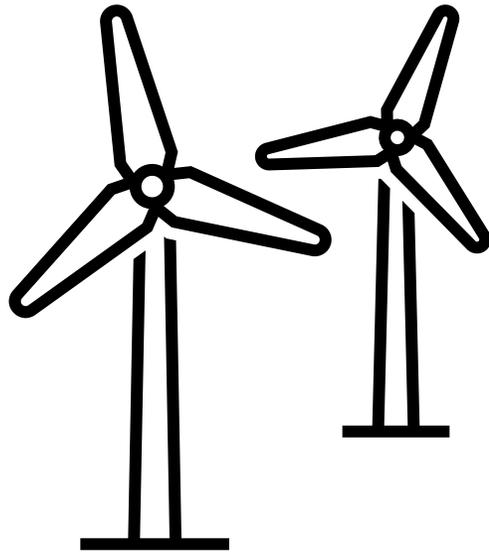

3%

We need a minimum of
3% deep energy efficiency
renovation per annum

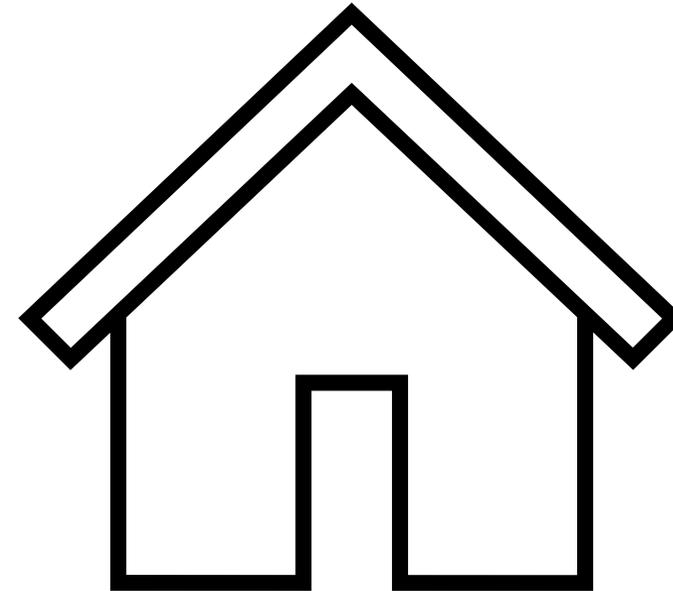

We are stuck at
around 0.3% today

0.3%

1 “The Market for Lemons” Failure

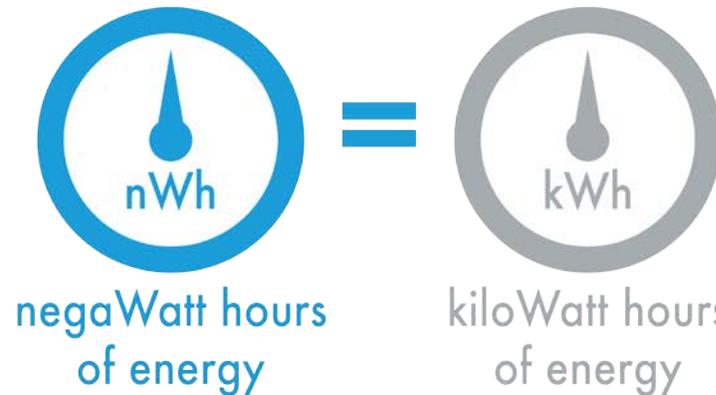

Performance

Measures

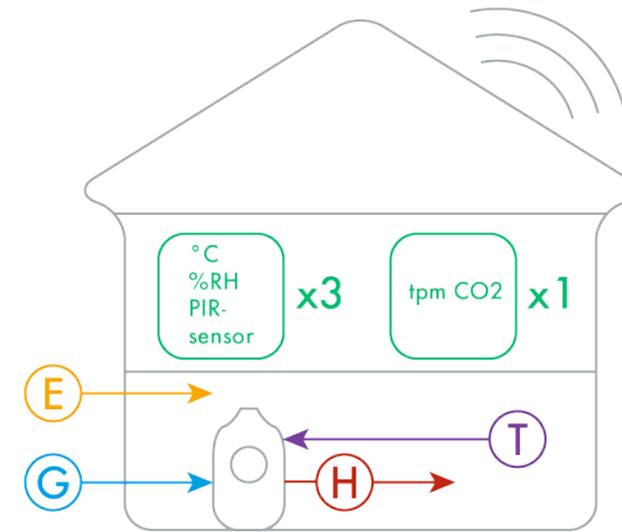

2 Technology Breakthrough Resolves Market Failure

FOR THE FIRST TIME
We can meter energy efficiency
the same way as energy generation

Now energy savings can be calculated day-after-day,
fabric energy performance properly benchmarked
& feedback loops provided on design / quality of works

2 Smart Connected Sensors Acquire & Act On Data

E Electricity Meter

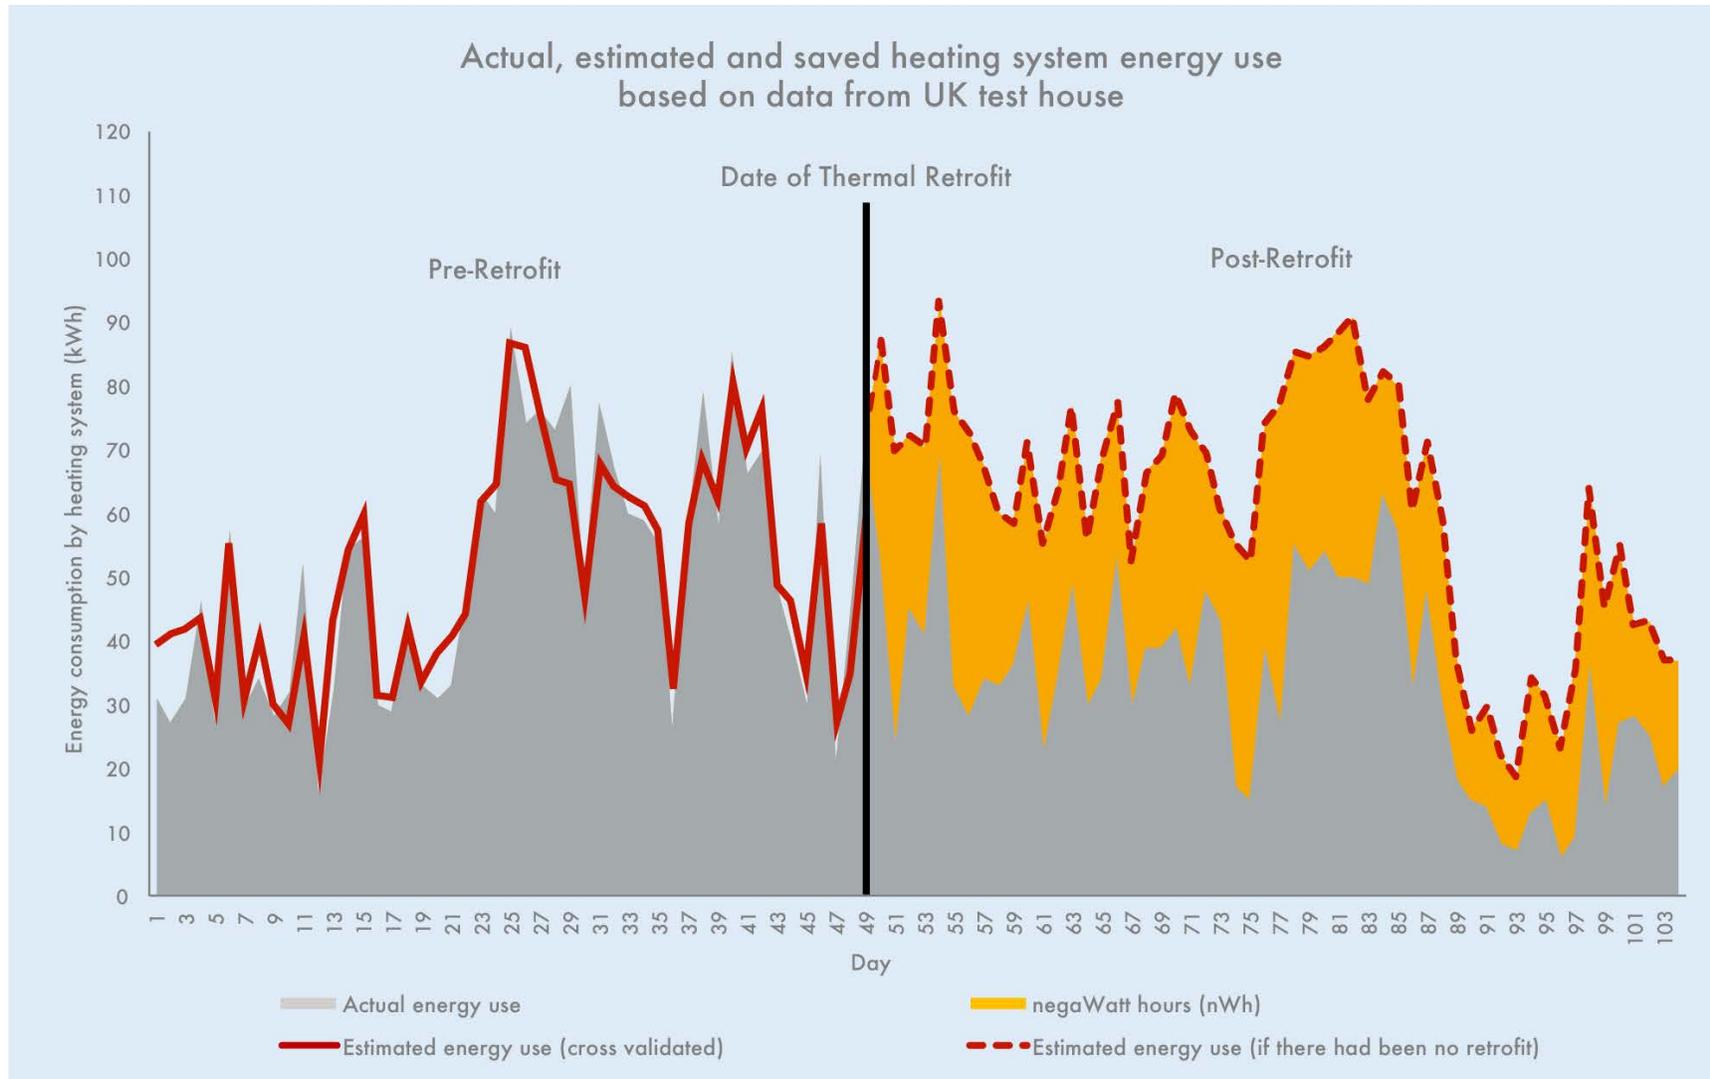

G Gas Meter

H Heat Meter on Central Heating Circuit

T Smart Thermostat

 Boiler (supplying domestic hot water and heating on separate circuits)

 Sensor boxes placed in representative zones according to house size and layout

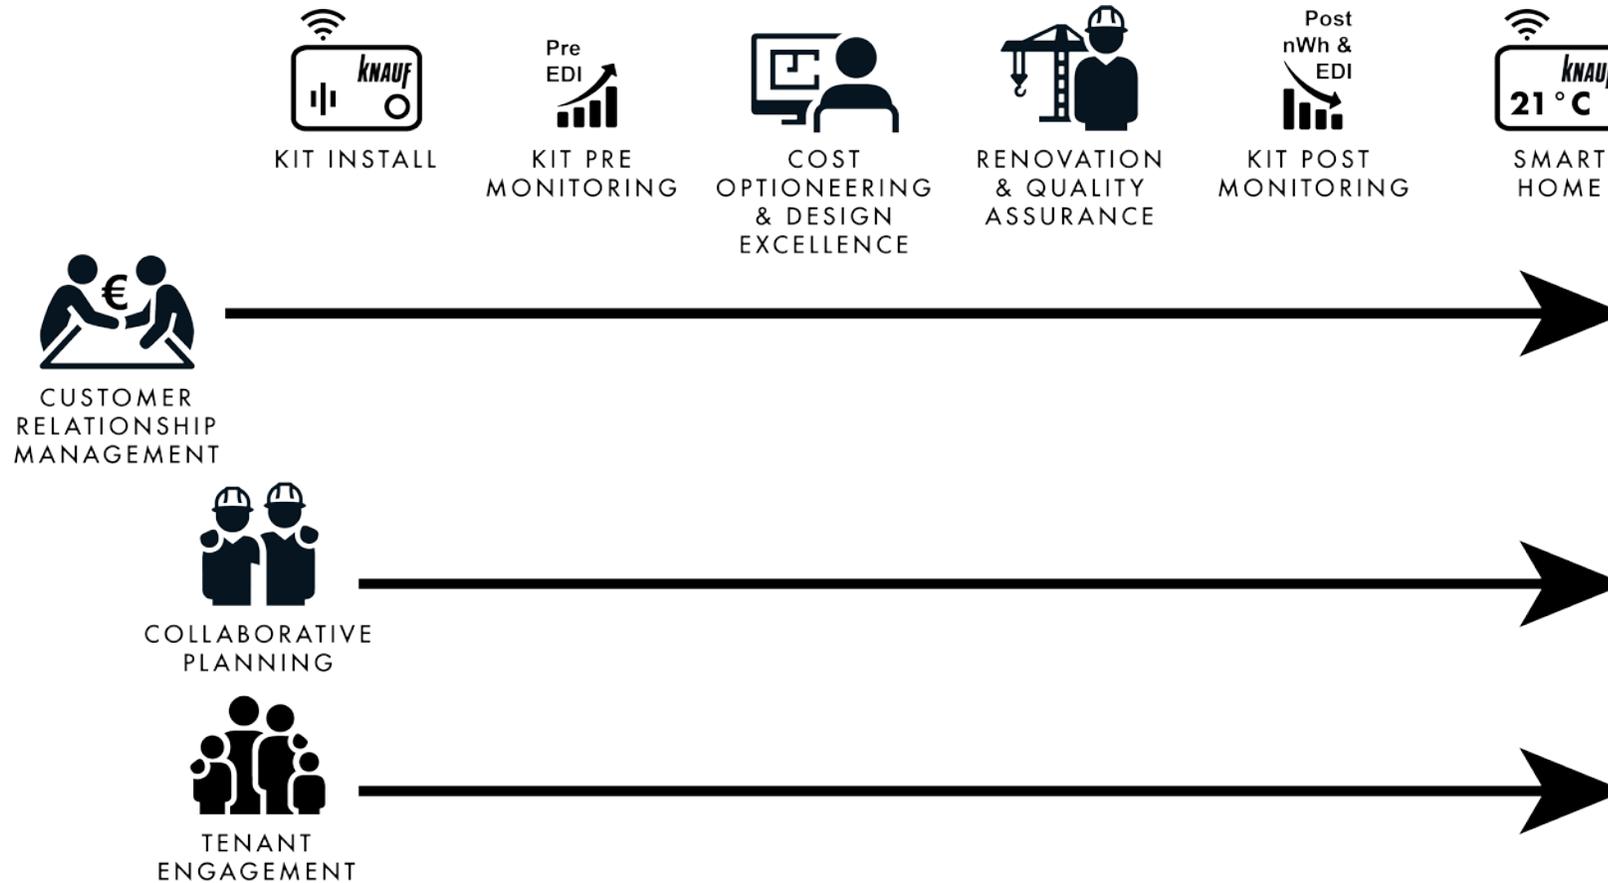

Machine Learning Enables Energy Demand Indicator (EDI)

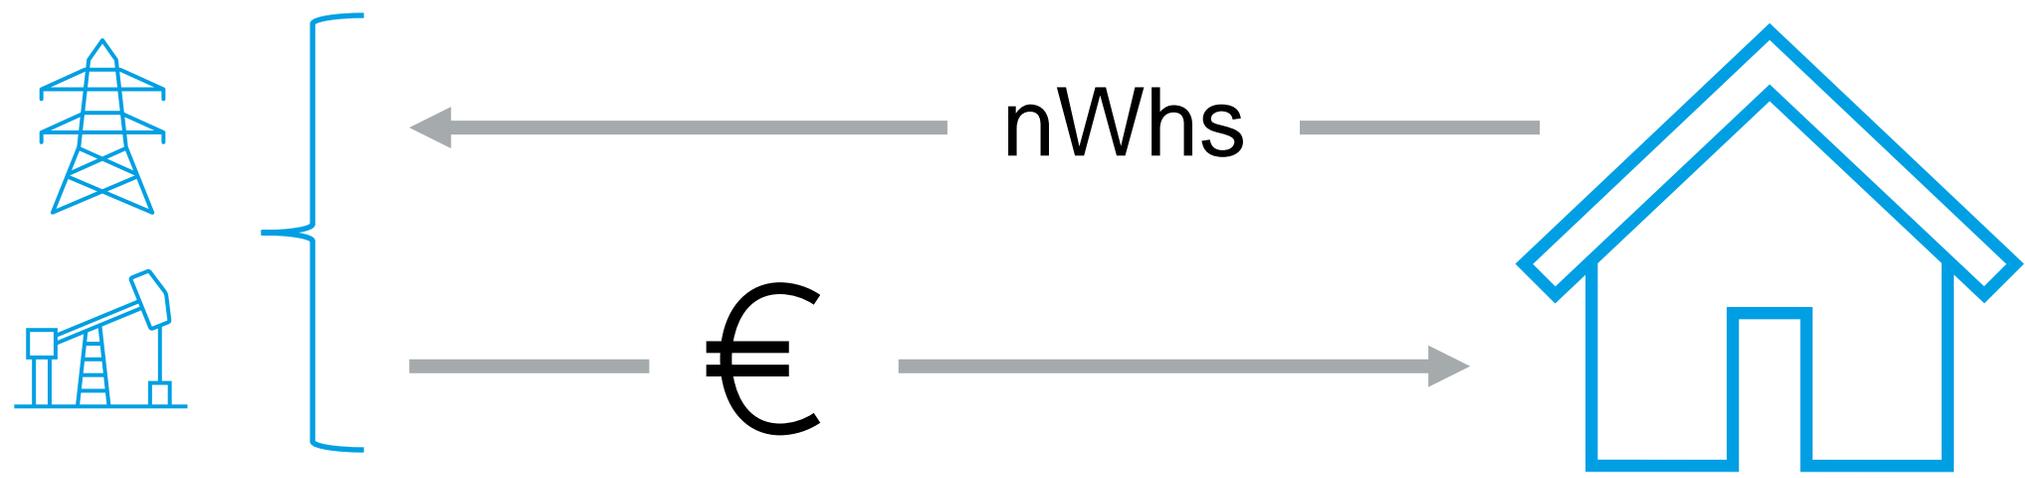

2 Proper Measurement Enables Effective One-Stop-Shops

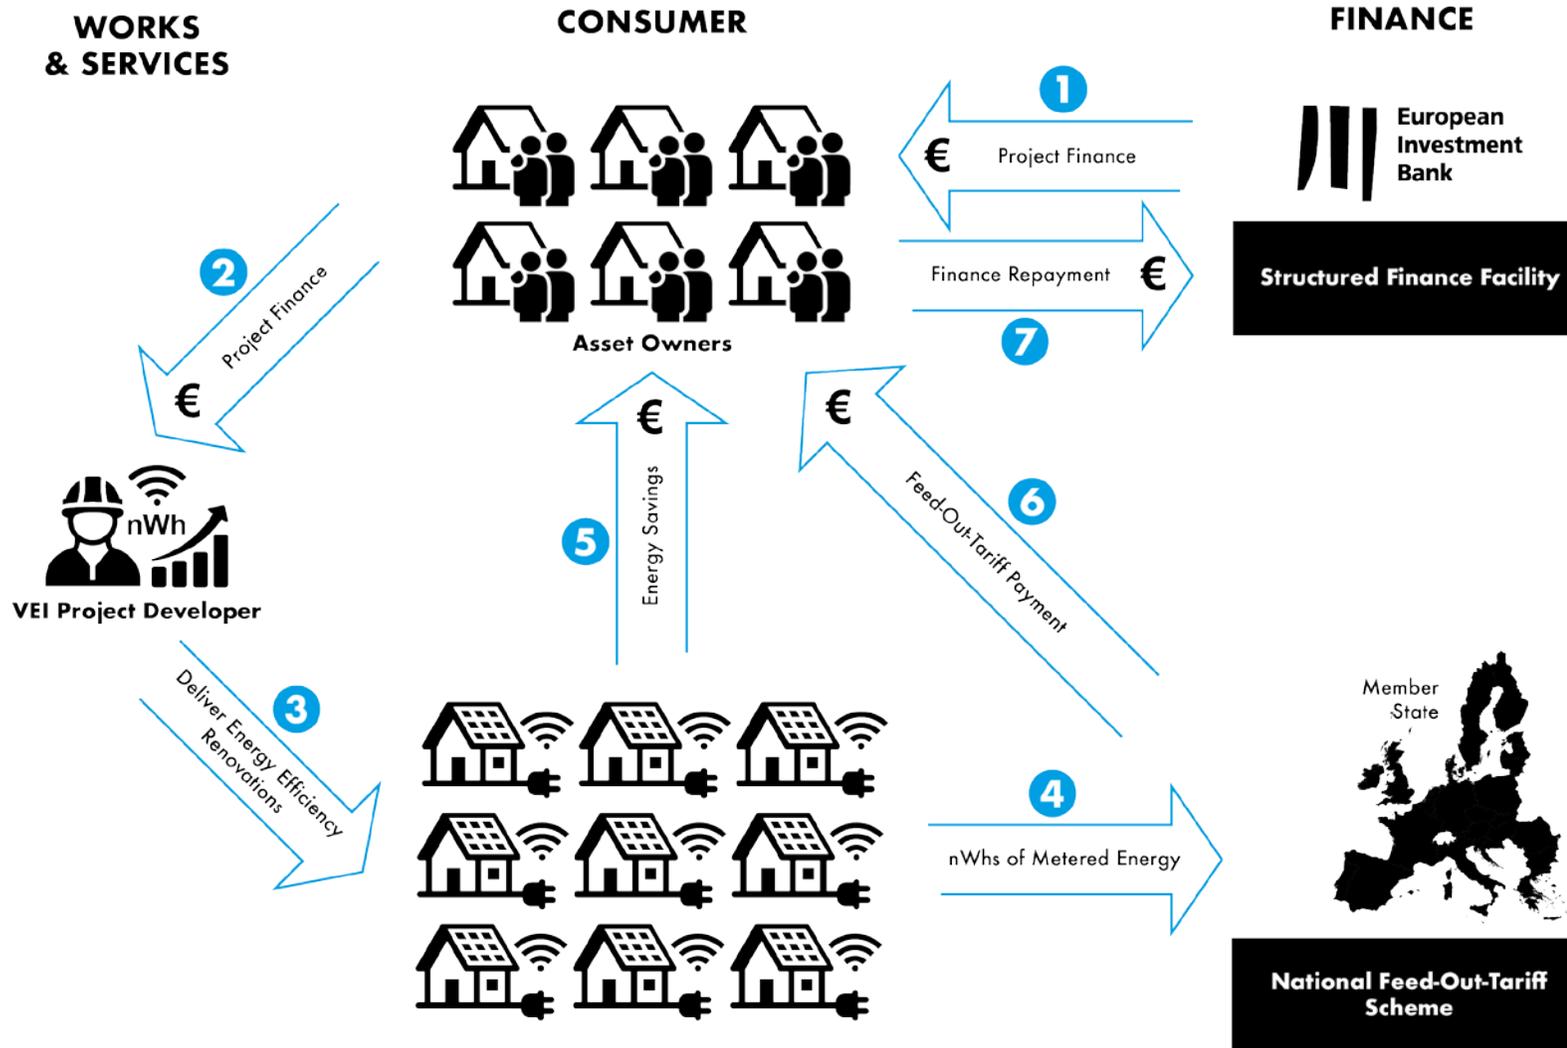

Project development companies, such as Knauf Energy Solutions, are now needed to manage barriers, aggregate demand and deliver scale

Negawatt Hours Allows Pay4Performance Approaches

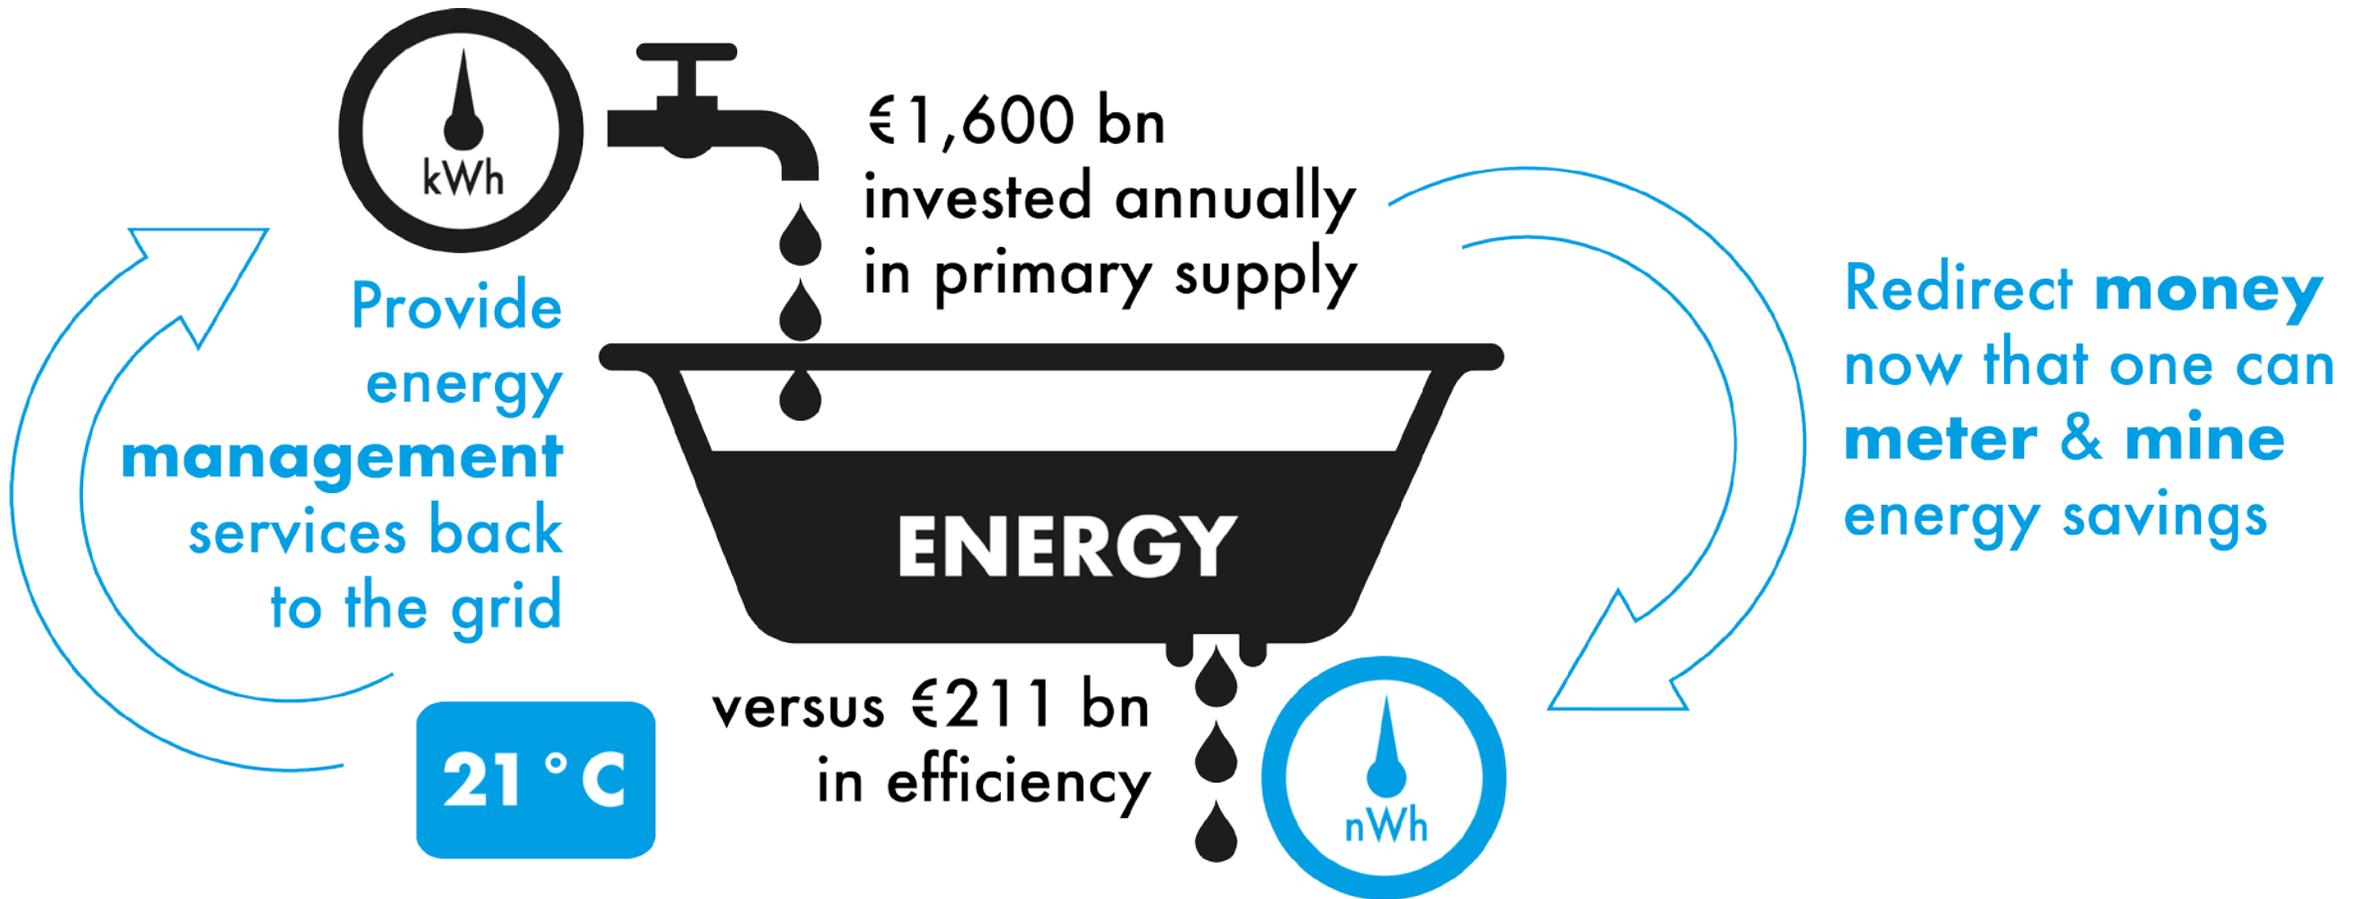

3 Opening-Up New Finance Structures

Feed-Out-Tariffs offer:

- Simplified support based on the real 'quantum' of energy saved
- An open ended support structure to upscale residential renovation
- Upfront low interest financing
- Easy bundling of support and finance
- Well suited to private residential market

3 Ushering in 21st Century Energy Companies

Thank You

12th EEMI Bauhaus
